CAMF10 is expressed in astrocytoma and glinoma-derived tissue. DNA encoding the AMF8 may be useful in gene therapy, and the protein cancer and other cell proliferative disorders. Generally, the cancer and other cell proliferative disorders. Generally, the cather of calmad other caids and proteins of the invention are useful for treating or preventing AMFX-associated disorders, e.g. a disorder related to cell signal processing and metabolic pathway modulation, chances triangly in trophic factor limited secondary tissue site microenvironments, connective tissue disorders tissue remodeling oncogenesis, connective tissue covary, cervix, prostate, endometrium, stomach, colon, lung, blandder, kidney, brain, and soft-tissue, cellular transformation, chantion and resorption, haematopoiesis, anglogenesis, multidrug resistance related to organic anion transporters, malignant disease cellular responses to external stimuli, and other diseases. Consecting and paractine requisition of cell growth, and cellular responses to external stimuli, and other diseases.
                                                                                                                                             New AMF1-10 polypeptides and encoding polynucleotides, useful for treating or preventing disorders related to modulation of cell movement, cell signal processing, cell adhesion or migration pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SKSANTITSFVDRGLDDLSHTPLRRQKYLFDVSMLSDKEELVGAELRLFRQAPSAPWGPP 180

The present invention relates to new isolated NOVX polypeptides named NOVI-NOV9. The invention can be used for identifying an agent (a cellular receptor or downstream effector) that binds to the polypeptide. The molecules of the invention are useful for treating or preventing wolvx-associated disorders in humans. The antibody of the invention is useful for determining the presence or amount of NoVX in a sample, and for treating a pathological state in a mammal. The method of the invention is useful for determining the presence of an amount of NOVX in a sample which is used as a marker for cancerous cell or tissue type. The molecules of the invention are useful in the manufacture of a medicament for treating or preventing cancer, tumour, bone disorders, any scular necrosis, allery, haematopoletic disorders, immune disorders, endometriosis, renal diseases, infections, inflammatory diseases, lung diseases, appendicitis, blood

The present invention relates to new extracellular messenger polypeptides and polynuclectides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, stroke, or Alzheimer's disease), autoimmune/inflammatory disorders (e.g. epilepsy, activated immune deficiency syndrome, AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), endocrine disorders (e.g. renal tubular acidosis, anaemia or cushing's syndrome), and cell proliferative disorders (e.g. annery, and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of extracellular messengers. XMES may also be used in the treatment of viral, bacterial, fundal, parasitic, protozoal and helminthic infections, trauma, disorders associated with hypoptiuitarism, hypothyroidism, hyperthyroidism or gonadal steroid hormones, and hypothyroidism, hyperthyroidism or gonadal steroid hormones, and sequence is human XMES-6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents cattle articular cartilage-derived morphogenetic protein-2 (CDMP-2). The N-terminal methionine and signal peptide is missing, but part of the pro-region, a typical proteolytic cleavage site and a C-terminal domain containing 7 highly conserved Cys residues characteristic of the transforming growth factor-beta gene family are present. A single N-glycosylation site is located in the pro-region. A consensus highly conserved motif in CDMP proteins (AAR95641) is present in the C-terminal domain. CDMP-2 is present in a purified cartilage extract (claimed) which stimulates local cartilage formation and repair when combined with a matrix and implanted in a mammal. The protein may be used in therapy of e.g. chondromalacia or osteoarthritis, to heal joint surfaces, or to repair cartilage after reconstructive surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins - used to stimulate the in vivo.

                                                                                                                                                                                                                                                  ö
                                                      BMP-12 related proteins are a subset of the BMP/TGF-beta/Vg-1

family of proteins, including BMP-12 and VL-1. VL-1 is designated
BMP-13. Like BMP-12, it is expected that BMP-13, as expressed by
mammalian cells such as CHO cells, exists as a hetrogeneous popn.

of active species of BMP-13 protein with varying N-termini. It is
ceppered that all active species will contain the AA sequence
beginning with the 19th Cys residue of the mature protein until
the 119th residue of the mature protein. Other active
after the 120th residue of the mature protein. Other active
species contain additional AA sequence in the N-terminal direction.
AAQ96208 is a partial DNA sequence and AAR78730 is the derived AA
sequence of a portion of the 2.5 kb DNA insert of the plasmid
subclone pGEMJLDC31/2.5, derived from clone lambdaJLDC31.

This polypeptide comprises a novel bone morphogenetic protein, designated BMP-13 that induces tendon and ligament formation. Its amno acid sequence was deduced from isolated genomic clone v1-1 (see AAT90386). A claimed method for inducing formation of tendon and/or ligament tissues involves the administration of a composition containing at least one protein selected from BMP-13, MP52 (see AAW26590) and BMP-12 (see AAW2689). The method is used for tissue (including skin) healing and repair. This is useful for treating tendonitis, carpal tunnel syndrome and other defects of traumatic or congenital origin, in cosmetic surgery and to improve fixation of tendons or ligaments to bone. The specified proteins can also be used to increase activity of other BMPs e.g. BMP-2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a chimeric DNA comprising a DNA sequence encoding a propeptide from a member of the transforming growth factor (TGF)-beta superfamily of proteins. This DNA is linked to a DNA sequence encoding an amino acid sequence encoding a mature polypeptide consisting of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA sequences are useful for producing proteins which induce tendon/ligament like tissue formation, and for isolating and cloning further DNA sequences encoding BMP-12 related proteins with similar activity. The proteins are useful for the induction of tendon/ligament-like tissue formation, wound healing, ligament and other tissue repair, augmenting the activity of bone morphogenetic proteins, and for treating tendonitis, the activity of bone morphogenetic proteins, and for treating tendonitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New chimeric DNAs, useful for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects, comprises DNA encoding propeptide linked to DNA encoding bone morphogenetic proteins (BMP)-12,
                                                                                                                                                 Human; bone morphogenic protein; BMP-13; vulnerary; antiinflammatory; analgesic; gene therapy; transforming growth factor-beta; TGF-beta; tissue formation; wound healing; tissue repair; ligament defect; VL-1; carpal tunnel syndrome; tendonitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tunnel syndrome and other tendon and ligament defects. The sequence is human VL-1 protein also designated as BMP-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 321;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GH;

This probe was radioactively labelled and used to screen a murine genomic library. DNA sequence analysis of one of positively hybridising recombinants named MNR32 indicates that it encodes a portion of the mouse gene corresp. to the PCR product mV2 (murine homolog of the human VL-1 sequence AAQ96213.

Mouse; bone morphogenic protein; BMP-12; vulnerary; antiinflammatory; analgesic; gene therapy; transforming growth factor-beta; TGF-beta; tissue formation; wound healing; tissue repair; ligament defect; carpal tunnel syndrome; tendonitis; mV2.
                                                                           This polypeptide comprises a fragment of a murine homologue of human bone morphogenetic protein 12 (BMP-13) (see also AMW2551). Its amino acid sequence was deduced from DNA subclone mV2 (see AAT903997), isolated from murine genomic DNA using primers (see AAT90393-94) based on human BMP-12 sequences. Human BMP-13, BMP-12 (see AAW25689) and MP52 (see AAW25690) polypeptides are used in a claimed method for inducing tendon and ligament formation.
                                                                                                                                                                                                                                                                          180 PAGPLHVQLFPCLSPLLLDARTLDPQGAPPAGWEVFDVWQGLRHQPWKQLCLELRAAWGE

                                                                                                                                                                                                                           The invention relates to a chimeric DNA comprising a DNA sequence encoding a propeptide from a member of the transforming growth factor (1GF)-beta superfamily of proteins. This DNA is linked to a DNA sequence encoding an amino acid sequence encoding a mature polypeptide consisting of Bone Morphogenetic Protein (BMP)-12, BMP-13 or MP52 protein. The DNA sequences are useful for producing proteins which induce tendon/ligament like tissue formation, and for isolating and cloning further DNA sequences encoding BMP-12 related proteins with similar activity. The proteins are useful for the induction of tendon/ligament-like tissue formation, wound healing, ligament and other tissue repair, augmenting the activity of bone morphogenetic proteins, and for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects. The present sequence is murine partial mV2 protein which is homologous to human BMP-12 or VL-1 sequences of the invention.
                                                                                                                                                New chimeric DNAs, useful for treating tendonitis, carpal tunnel syndrome and other tendon and ligament defects, comprises DNA encoding propeptide linked to DNA encoding bone morphogenetic proteins (BMP)-12,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180 PAGPLHVQLFPCLSPLLLDARTLDPQGAPPAGWEVFDVWQGLRHQPWKQLCLELRAAWGE 239

```
The amino acid sequence of a novel member of the transforming growth deactor-beta (TGF-b) family named Mp-52. The gene encodes a protein of 501 amino acids (AA). The protein, or at least the mature protein, has mitogenic and/or differentiation inducing properties useful in the treatment or prevention of diseases of bone, cartilage, connective tissue, skin, mucosa, epithelium or dental tissue. The protein can also be used for wound healing and tissue regeneration e.g. in osteoporosis
treatment; prevention; disease; bone; cartilage; connective tissue; skin; mucosa; epithelium; dental tissue; wound healing; osteoporosis; tissue regeneration; arthritis; ss.

The method can be used to produce MP52, BMP-2, BMP-4, BMP-6 and BMP-7, abhormalities.

```
This sequence is the human transforming growth factor (TGF)-beta protein designated MP52. MP52 can be used in a compound of formula (I): A-X(1-20)-B(1-20) (I); A = protein, or fragment, of the TGF-beta superfamily with cartilage and/or bone inducing activity (e.g. MP52); B = I or more substituent groups with an affinity to the extracellular matrix, caplular components of bone and/or cartilage and/or to a biocompatible carrier matrix; X = I or more covalent bonds and/or spacer groups. The compound may be used to inhibit bone resorption, prevent or treat bone or cartilage related disorders, including osteoporasis, Paget's disease, osteodystrophy, osteoarthris or osteoarthropathy and to treat bone or cartilage damage caused by wounding or overloading.
                                                                                                                                                                                                                                                                                                                                               407
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        453

Funding for cattle EST sequencing was provided by the USDA National Research Initiative, Animal Genome Resource Grant AG 99-3205-8534 to H. A. Lewin and J. E. Wonack. Base Calling/Quality Scores: PHRED from Washington University Genome Center. Vector Trimmi g: Cross_match from Washington University Genome Center PHRAP suite. This sequence is vector free and at least 200 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BF044119 563 bp mRNA linear EST 10-OCT-2000 BP250023A10F2 Soares normalized bovine placenta Bos taurus cDNA clone BP250023A10F2 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bovidae; Bovinae; Bos.

The remaining single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the UT-R-C3 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996).

EST from a cDNA of a gene whose expression is spatially restricted during embryogenesis. We have established its expression pattern during embryonic development by whole mount in situ hybridization on zebrafish embryos from the gastrula stage to 2 days of development. The corresponding data are available on the zebrafish community database at http://zfin.org/cDNA library preparation: B. Riggleman. DNA Sequencing by:IGBMC sequencing facility. Clone distribution: zebrafish international resource center at the University of Oregon (Institute of Neuroscience, 1254 University of Oregon; Eugene, OR 97403-1254)

Seq primer: T3 ATTAACCCTCACTAAAGGGA.
